

KNUCKLE JOINT

PRODUCT 10-020

The **TechWest Knuckle Joint** is a 360° bendable joint that is able to hold both tension and compression.

The Knuckle Joint is used in highly deviated applications on conventional or coiled tubing to remove the bending moment from the tubing string. This extends the usable run life of the tubing. The tool also allows more weight to be transferred to the BHA, improving likelihood of retrieving the string in a sticky wellbore.
